- 3 An Example
- 4 Preliminaries
- 5 Language
- 6 Implementation
- 7 Experimental analysis
 - Boosting optimization via heuristics
 - Dedicated systems versus asprin
- 8 Summary

Motivation

- Answer Set Programming (ASP) is an approach to **declarative problem solving**, combining
 - a rich yet simple modeling language
 - with high-performance solving capacities

tailored to Knowledge Representation and Reasoning

- ASP allows for solving all search problems in NP (and NP^{NP}) in a uniform way
- ASP is versatile as reflected by the ASP solver *clingo*, winning first places at ASP, CASC, MISC, PB, and SAT competitions
- ASP embraces many emerging application areas, and users

Motivation

- Answer Set Programming (ASP) is an approach to declarative problem solving, combining
 - a rich yet simple modeling language
 - with high-performance solving capacitiestailored to Knowledge Representation and Reasoning
- ASP allows for solving all search problems in NP (and NP^{NP}) in a uniform way
- ASP is versatile as reflected by the ASP solver *clingo*, winning first places at ASP, CASC, MISC, PB, and SAT competitions
- ASP embraces many emerging application areas, and users

 - a rich yet simple modeling language
 - with high-performance solving capacitiestailored to Knowledge Representation and Reasoning
- ASP allows for solving all search problems in NP (and NP^{NP}) in a uniform way
- ASP is versatile as reflected by the ASP solver *clingo*, winning first places at ASP, CASC, MISC, PB, and SAT competitions
- ASP embraces many emerging application areas, and users

Motivation

- For real-world applications, the identification of preferred, or optimal, solutions is often indispensable

In many cases, this also involves the combination of various qualitative and quantitative preferences

- Only optimization statements representing objective functions using summation are established components of today's ASP systems
- Example `#minimize{40 : coast; 70 : mountain}`

Motivation

- For real-world applications, the identification of preferred, or optimal, solutions is often indispensable

In many cases, this also involves the combination of various qualitative and quantitative preferences

- Only optimization statements representing objective functions using summation are established components of today's ASP systems
- Example $\#minimize\{40 : coast; 70 : mountain\}$

Approach

- **asprin** is a framework for handling preferences among the (stable) models of logic programs
 - general because it captures many existing approaches to preference
 - flexible because it allows combining different types of preferences
 - extensible, allowing for an easy implementation of new approaches to preferences

Approach

- asprin is a framework for handling preferences among the (stable) models of logic programs
 - general because it captures many existing approaches to preference
 - flexible because it allows combining different types of preferences
 - extensible, allowing for an easy implementation of new approaches to preferences

An Example: Travelling Salesperson

Travelling Salesperson

- Problem instance A map with cities, directed roads with distances, and one starting city
- Problem class Find a route visiting every city once, and returning to the starting city

Travelling Salesperson

- Problem instance A map with cities, directed roads with distances, and one starting city
- Problem class Find a route visiting every city once, and returning to the starting city

Travelling Salesperson

Travelling Salesperson

- Problem instance A map with cities, directed roads with distances, and one starting city

```

city(a). city(b). city(c). city(d). start(a).
road(a,b,4). road(a,c,5). road(b,c,3). road(b,d,5).
road(c,a,5). road(c,b,3). road(c,d,4).
road(d,a,3). road(d,c,4).
  
```

Travelling Salesperson

- Problem class Find a route visiting every city once, and returning to the starting city

```
{ travel(X,Y) } :- road(X,Y,D).
```

```
visited(Y) :- start(X), travel(X,Y).
```

```
visited(Y) :- visited(X), travel(X,Y).
```

```
:- city(X), not visited(X).
```

```
:- city(X), 2 { travel(X,Y) }.
```

Travelling Salesperson

- Problem class Find a route visiting every city once, and returning to the starting city

```
{ travel(X,Y) } :- road(X,Y,D).
```

```
visited(Y) :- start(X), travel(X,Y).
```

```
visited(Y) :- visited(X), travel(X,Y).
```

```
:- city(X), not visited(X).
```

```
:- city(X), 2 { travel(X,Y) }.
```

Travelling Salesperson

- Problem class Find a route visiting every city once, and returning to the starting city

```
{ travel(X,Y) } :- road(X,Y,D).
```

```
visited(Y) :- start(X), travel(X,Y).
```

```
visited(Y) :- visited(X), travel(X,Y).
```

```
:- city(X), not visited(X).
```

```
:- city(X), 2 { travel(X,Y) }.

- 2 Declarative Problem Solving
- 3 An Example
- 4 Preliminaries**
- 5 Language
- 6 Implementation
- 7 Experimental analysis
 - Boosting optimization via heuristics
 - Dedicated systems versus asprin
- 8 Summary

Preference

- A strict partial order \succ on the stable models of a logic program
That is, $X \succ Y$ means that X is preferred to Y
- A stable model X is \succ -preferred, if there is no other stable model Y such that $Y \succ X$
- A preference type is a (parametric) class of preference relations
- Example *subset*, *pareto*, etc.

where s and t represent the preference statement and its type
and each e_j is a preference element
- optimization directive $\#optimize(s)$
where s is the name of a preference
- preference specification is a set S of preference statements and a directive
 $\#optimize(s)$ such that S is acyclic, closed, and $s \in S$

Preference type

- A **preference type** t is a function mapping a set of preference elements E to a preference relation

$$t(E) \subseteq \mathcal{A} \times \mathcal{A}$$

- Examples

$$(X, Y) \in \text{subset}(E) \text{ iff } \{l \in E \mid X \models l\} \subset \{l \in E \mid Y \models l\}$$

$$(X, Y) \in \text{pareto}(E) \text{ iff } \bigwedge_{s \in E} (X \succeq_s Y) \wedge \bigvee_{s \in E} (X \succ_s Y)$$

Preference type

- A **preference type** t is a function mapping a set of preference elements E to a preference relation

$$t(E) \subseteq \mathcal{A} \times \mathcal{A}$$

- Examples

- $(X, Y) \in \text{subset}(E)$ iff $\{\ell \in E \mid X \models \ell\} \subset \{\ell \in E \mid Y \models \ell\}$
- $(X, Y) \in \text{pareto}(E)$ iff $\bigwedge_{**s \in E} (X \succeq_s Y) \wedge \bigvee_{**s \in E} (X \succ_s Y)$

Preference relation

- A **preference relation** is obtained by applying a preference type to a set of preference elements

$\#preference(s, t) E$ declares preference relation $t(E)$, denoted by \succ_s

- Example $\#preference(1, subset)\{a, b, c\}$ declares

$$X \succ_1 Y \text{ iff } \{l \in \{a, b, c\} \mid X \models l\} \subset \{l \in \{a, b, c\} \mid Y \models l\}$$

Preference relation

- A **preference relation** is obtained by applying a preference type to a set of preference elements

$\#preference(s, t) E$ declares preference relation $t(E)$, denoted by \succ_s

- Example $\#preference(1, subset)\{a, b, c\}$ declares

$$X \succ_1 Y \text{ iff } \{l \in \{a, b, c\} \mid X \models l\} \subset \{l \in \{a, b, c\} \mid Y \models l\}$$

Preference relation

- A **preference relation** is obtained by applying a preference type to a set of preference elements

$\#preference(s, t) E$ declares preference relation $t(E)$, denoted by \succ_s

- Example $\#preference(1, subset)\{a, b, c\}$ declares

$$X \succ_1 Y \text{ iff } \{l \in \{a, b, c\} \mid X \models l\} \subset \{l \in \{a, b, c\} \mid Y \models l\}$$

Basic algorithm $solveOpt(P, s)$

Input : A program P over \mathcal{A} and preference statement s

Output : A \succ_s -preferred stable model of P , if P is satisfiable, and \perp otherwise

$Y \leftarrow solve(P)$

if $Y = \perp$ **then return** \perp

repeat

$X \leftarrow Y$
 $Y \leftarrow solve(P \cup Q_s \cup R \cup H'_X)$

until $Y = \perp$

return X

where $R = \{holds(a) \leftarrow a \mid a \in \mathcal{A}\}$

asprin's library

- Basic preference types
 - subset and superset
 - `less(cardinality)` and `more(cardinality)`

Heuristic framework

- *clingo* allows for incorporating domain-specific heuristics into ASP solving
 - input language for expressing domain-specific heuristics
 - solving capacities for integrating domain-specific heuristics
- Heuristic directive `#heuristic`
- Heuristic modifiers `(atom, a, and integer, v)`
 - `init` for initializing the heuristic value of *a* with *v*
 - `factor` for amplifying the heuristic value of *a* by factor *v*
 - `level` for ranking all atoms; the rank of *a* is *v*
 - `sign` for attributing the sign of *v* as truth value to *a*
- Heuristic statements
 - `#heuristic occurs(A,T) : action(A), time(T). [T,factor]`

Heuristic framework

- *clingo* (using branch-and-bound)
- *asprin_w*
- *asprin_w -f*
- *w* — weight-based
- *-f* — no phase saving
- *metasp* (using disjunction)
- *asprin_s*
- *asprin_s -f*
- *s* — subset-based
- *-f* — no phase saving

aso versus *asprin*

- *satpref*

- *satpref+s*

- *satpref+H*

- s — sign heuristic

- H — complex heuristic

- *asprin_p*

- *asprin_p+s*

- *asprin_p+H*

- s — sign heuristic

- H — complex heuristic

Outline

- 1 Introduction
- 2 Declarative Problem Solving
- 3 An Example
- 4 Preliminaries
- 5 Language
- 6 Implementation
- 7 Experimental analysis
 - Boosting optimization via heuristics
 - Dedicated systems versus asprin
- 8 Summary

Summary

- *asprin* stands for “ASP for Preference handling”
- *asprin* is a general, flexible, and extendable framework for preference handling in ASP
- *asprin* caters to
 - off-the-shelf users using the preference relations in *asprin*'s library
 - preference engineers customizing their own preference relations
- *asprin* can be boosted by *clingo*'s heuristic framework
- <https://github.com/potassco/asprin>

Summary

- asprin stands for “ASP for Preference handling”
- asprin is a general, flexible, and extendable framework for preference handling in ASP
